For fiber laser between 890 - 1100 nm
iXblue Photonics offers a complete range of Neodymium fibers with some unique properties.

iXblue Photonics Neodymium Aluminosilicate double clad fibers have been developed to maximize fiber efficiency through a precisely controlled host composition. Compared to a standard Neodymium fiber, the 1.06-micron emission is reduced through careful fiber design optimization. Our double clad fibers are routinely tested to various parameters such as photodarkening and environmental behavior.

A single clad fiber is also proposed and would be ideal to build seeder sources in the 10xx nm range.

Key Features
• Host composition optimized for high energy efficiency and low clustering
• Low splicing losses
• High NA, high performance low-index cladding
• Low background losses
• Low macrobending losses at operating wavelength

Applications
• 0.9 to 1.064 µm fiber lasers
• Seeder source at 10xx nm

Related Products
• Matching passive fiber
• Associated fiber Bragg mirror

* Associated passive fibers, as well as a fiber combiners adapted to this fiber

Common specifications
• MM background (dB/km) < 50
• Cladding NA ≥ 0.46
• Core-clad offset (µm) < 1.0
• Proof test level (kpsi) 100
• LP01 cutoff wavelength (µm) 1
• Operating wavelength (nm) 900 - 950
